ABSTRACT

Average numbers of waterfowl harvested during the 1961-70 hunting seasons are estimated by species for each county in the continental United States. A brief account of the estimating procedure is included.

Introduction

Nationwide surveys of waterfowl harvest in the United States began in 1952 with the initiation of a waterfowl hunter questionnaire survey designed to provide annual estimates of harvest (retrieved waterfowl kill) for each administrative flyway. By 1960, surveys had been expanded to provide more reliable estimates for individual States. In 1961, duck wing collection surveys were operating in all four flyways and, in 1962, nationwide collections of goose tails were initiated. When combined in 1965, duck wing and goose tail surveys became known as the "Waterfowl Parts Collection Survey." A combination of parts collection and questionnaire surveys made possible more precise estimates of the annual harvest for individual species and permitted estimates of geographic distribution for those harvests. Estimates of average annual duck (10 years) and goose (9 years) harvests by species for each county in the continental United States through the 1970-71 hunting season are summarized in the tables. The approximate distribution of waterfowl hunters among counties for the same period has been summarized by Schroeder, et al. (1974). State-level estimates of waterfowl harvests are published annually as "Waterfowl Status Reports" in the Fish and Wildlife Service's Special Scientific Report series.

Estimating Procedure

Annual waterfowl harvest estimates have been made by combining information from the following sources: 1) sales of migratory waterfowl hunting stamps (duck stamps) as reported by the U.S. Postal Service; 2) averages of retrieved kill as reported by hunters in the Service's Waterfowl Hunter Questionnaire Survey; and 3) numbers of wings or tails of each species received in the Service's Waterfowl Parts Collection Survey. The following annual procedure used in combining these data is diagramed in Fig. 1.

To obtain a list of waterfowl hunters, a sample of post offices was randomly selected by means of a computer program and each post office was sent a supply of postcards (contact cards) which were distributed to stamp buyers. Buyers recorded their names and addresses, indicated whether or not they intended to hunt waterfowl, and returned the cards. At the close of the hunting season, approximately 100,000 questionnaires were sent to potential hunters, and their answers were used to calculate the average number of ducks and geese bagged per hunter in each State. To compensate for exaggeration bias, these

WATERFOWL HARVEST SURVEYS

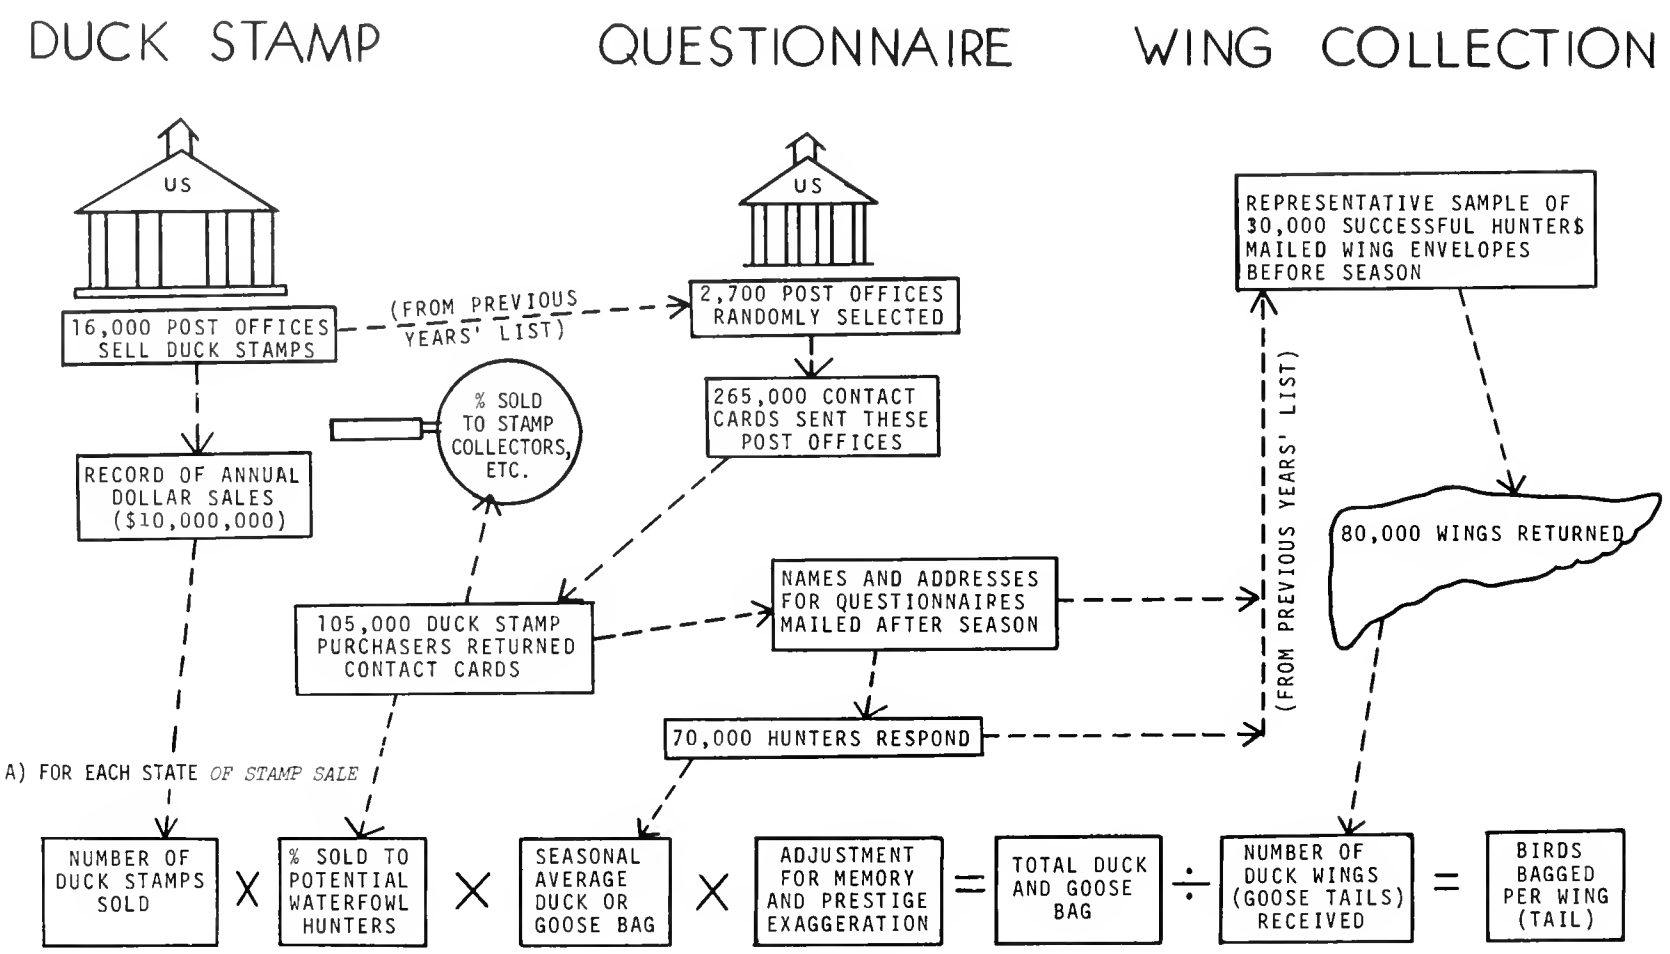

Fig. 1. General procedure followed in estimating annual duck and goose harvest by species.

averages were adjusted downward 13-26% (Atwood, E. L. 1959. Procedures for removing the effect of response bias errors from waterfowl hunter questionnaire response. Unpublished report, U.S. Fish and Wildlife Service, Laurel, Md. 22 pp.). These adjusted averages were then multiplied by numbers of potential hunters in a State to estimate the number of ducks and geese harvested. More detailed discussions of this procedure may be found in Chamberlain et al. (1971) and Martin and Carney (in preparation).

To obtain harvest information by species, State, and county, approximately 30,000 successful respondents to the previous year's questionnaire were sent supplies of franked envelopes, and asked to return a wing or tail from each duck or goose they might bag during the coming season. Dividing estimates of total ducks and geese harvested by the number of duck wings or goose tails submitted gave the harvest each wing represented. These values were apportioned to the States and counties where birds were reported (on the envelopes) to have been shot. County of harvest was unreported for less than 1% of the wing records, and the numbers of birds these represented were prorated to the known distribution. Annual estimates for each county were then summed and averaged for this report.

Sampling is complex, and procedures for estimating sampling variances from Waterfowl Hunter Questionnaire and Waterfowl Parts Collection Surveys have not been developed. Their development represents a pressing need. Although sampling variances at the State level may be large (particularly for minor species) and harvest estimates by county are undoubtedly imprecise, we feel they represent the distribution pattern of the harvest.

Species Identification

Species separation was accurate with a few exceptions. Mallard wings that appeared to differ markedly from those of "normal" mallards were classified as "hand-reared" mallards ("Mallard H.R." in tables). Although every attempt has been made to maintain a consistent procedure, this separation was subjective and, therefore, inexact. Mallard-black duck hybrids, wings intermediate in appearance between the two species, ("Mallard X B." in tables) were subject to the same limitation. No reliable criterion has been found for separating blue-winged from cinnamon teal wings and figures presented are of these species combined. Before sufficient reference material became available in 1965, Barrow's goldeneyes were incompletely separated from common goldeneyes. Some immature king eiders may have been classified as common eiders. Muscovy ducks were not recorded until 1969 when wild stock was released in Florida. Mexican ducks were not sought among wings received from

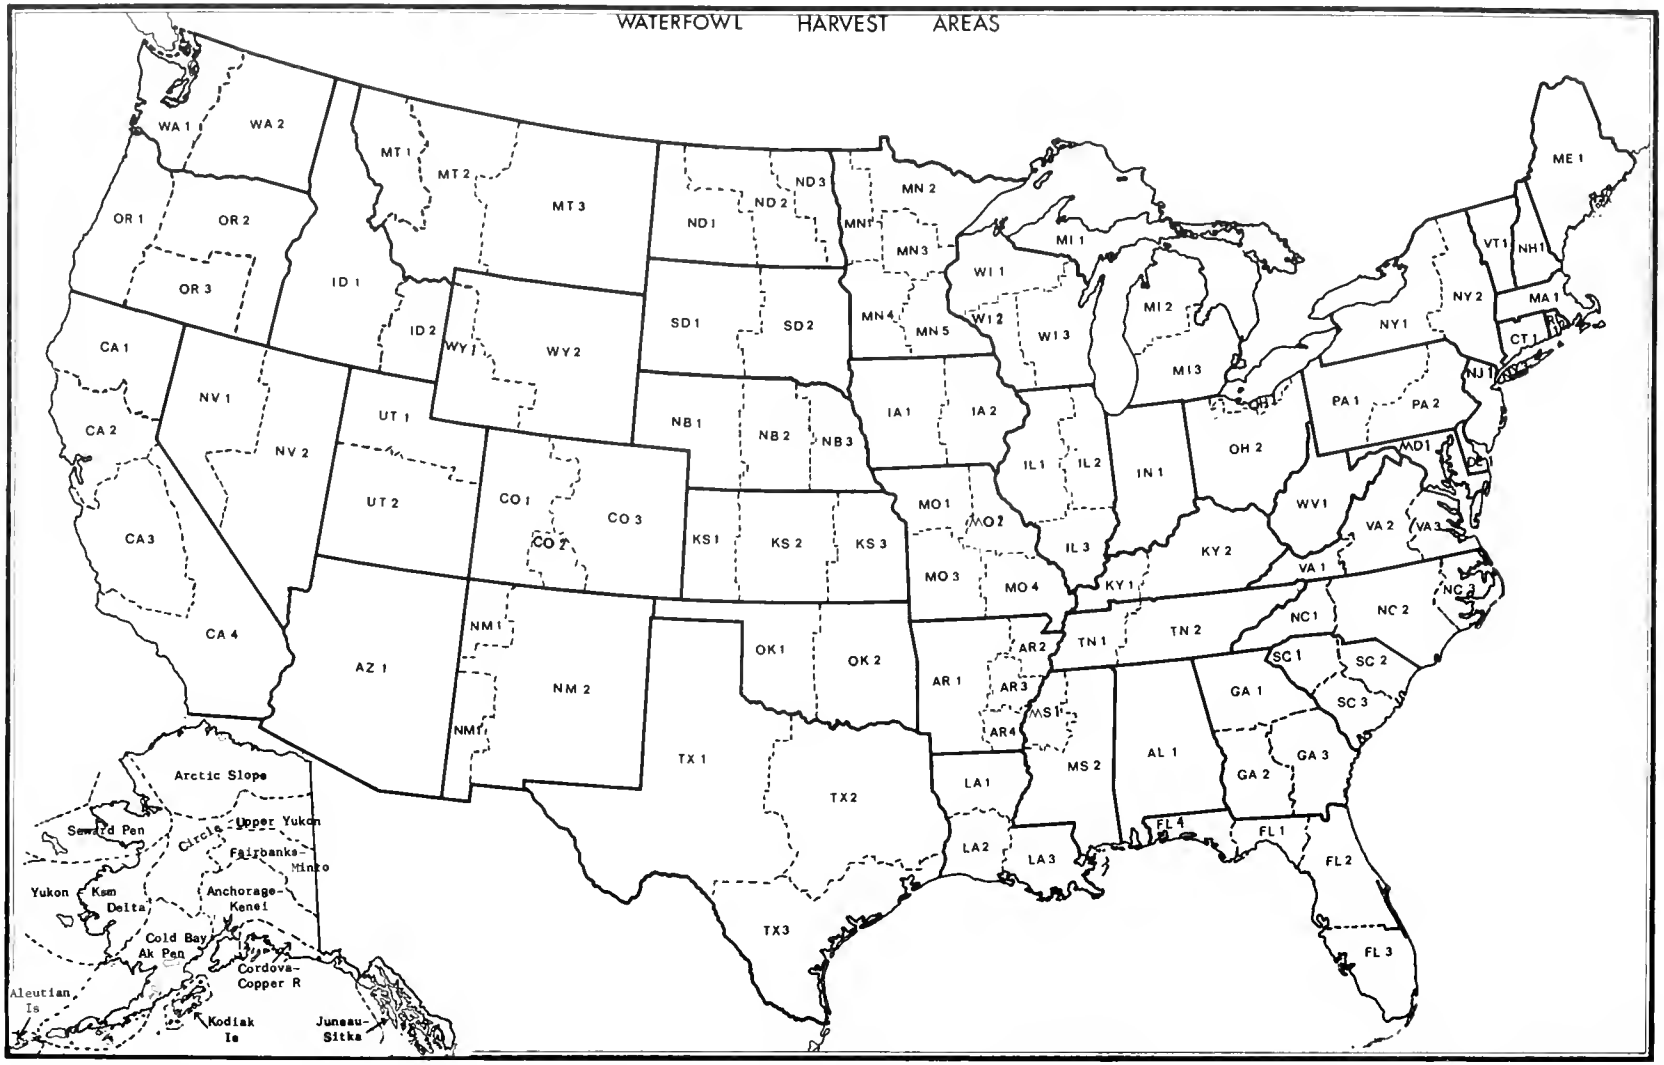

Fig. 2. Waterfowl harvest areas and areas in Alaska designated as "counties" within this report.

Texas and possibly were incompletely identified among wings from Arizona and New Mexico before reference material became available in 1967. In the Gulf States, some mottled ducks may have been classified as black ducks. Among geese, some Ross' geese may have been classified as snow geese, and subspecies of Canada geese could not be separated and, consequently, are represented by combined figures. Common and scientific names (Table 1) are those recognized by the American Ornithologists' Union (1957, 1973).

Organization of this Report

Information relating to duck harvest is presented first. States are arranged in north-to-south order within flyways (Tables 2A-7B). Goose species composition is presented in Tables 8-13. Within States, counties are grouped into waterfowl harvest areas for convenient examination of the harvest in parts of States. Waterfowl harvest areas and areas considered as "counties" in Alaska are presented in Fig. 2. Totals for some counties in Montana, Wyoming, Colorado, and New Mexico are divided between the Pacific and Central Flyways because of boundary changes during the period covered.

Information Included

Estimates presented here represent waterfowl harvested during all regular and special seasons including those experimental seasons for which the harvest was estimated from permits issued rather than duck stamps sold. For the contiguous States, estimates of duck harvest are for 1961-70 and estimates of goose harvest are for 1962-70. Alaskan harvest estimates for both ducks and geese are for 1966-70. Data presented here were derived from 805,040 duck wings, 72,315 goose tails, and 562,232 questionnaire responses and expanded from 17,573,564 duck stamps and 612,902 free permits.

Acknowledgments

This compilation reflects the combined efforts of many individuals and agencies. The Waterfowl Hunter Questionnaire Survey originated under the guidance of Earl L. Atwood, and the Parts Collection Survey was initiated by Aelred D. Geis; Walter F. Crissey aided with initial planning. The Waterfowl Parts Collection Survey has remained an outstanding example of Federal-State cooperation, from early financial support by the Flyway councils to continued annual participation of technicians at "wing bees." Organizations whose personnel participated in wing examination sessions are listed in Table 14. Additional help

has come from the Service's Divisions of Federal Aid, Law Enforcement, Wildlife Refuges, and Wildlife Services (now Technical Assistance). The U.S. Postal Service supplied annual records of duck stamp sales. Many people have been employed in what is now the Section of Waterfowl Harvest Surveys. Among those responsible for preparing annual estimates during the period were: David R. Anderson, Robert L. Croft, Alfred J. Godin, Robert G. Heath, Charles H. Lobdell, M. Edwin Rosasco, M. Glen Smart, and Clinton F. Wells. Those who prepared the surveys for mailing and coded the data received for machine processing are listed in Table 15. Donald E. Coyne developed the programs for editing files, and Noah A. Sealock programed the computer-printed tables. Carolyn J. Jarels typed the text and prepared the figures. Henry M. Reeves and Lonnie D. Schroeder reviewed the manuscript. Finally, we acknowledge the sustained cooperation of the U.S. waterfowl hunter. Without his support, this report would have been impossible.

☆ U.S. GOVERNMENT PRINTING OFFICE : 1975 O - 573-026

As the Nation's principal conservation agency, the Department of the Interior has responsibility for most of our nationally owned public lands and natural resources. This includes fostering the wisest use of our land and water resources, protecting our fish and wildlife, preserving the environmental and cultural values of our national parks and historical places, and providing for the enjoyment of life through outdoor recreation. The Department assesses our energy and mineral resources and works to assure that their development is in the best interests of all our people. The Department also has a major responsibility for American Indian reservation communities and for people who live in island territories under U.S. administration.
